

j-AIWG

Education Group January 26, 2026

Itinerary

- Feedback from audiences or JUGS on what folks would be interested in hearing.
- What's Next?

My Observations

- I missed an opportunity to ask during Decembers AJUG
- I did ask in January and got stares :-)
 - They didn't know what to ask.
- But it started a conversation →

Created a conversation on AI

- Profile: In Atlanta(US South East) Enterprise customers
- Tooling:
 - Nearly unanimous count for folks using it for development
 - But are right sizing the usage.
 - Ie. there are things it helps with
 - Others it is bad at
 - Depends on the goal
- Folks are moving toward Agentic (Goal based) agents.
 - MCP is a component of it
 - A2A wasn't really mentioned.

NOTES

- Many companies are looking for guidance with Non Deterministic AI(Lize)
 - + 1 from Catalin
 - They don't know what to require (what to do)
 - Provide opinions and solutions (Catalin)
- Enterprise patterns(Lize)
 - Provide samples:
 - For example Human in the loop
 - Have community help maintain these samples
 - For the Java community
- There are samples out there but they are scattered.
-

Notes (cont)

- Benchmarking is misleading (Miro)
 - The papers are small and tweaked to confirm the results of the paper
 - Then used by small companies as a selling point which is misleading
 - JPop
 - Companies are stuck because they don't have a consistent input
 - Which causes failed projects
 - How do companies get context?
 - What does benchmarking mean in the realm of LLM
 - How do they read it?
- MIT report says that 95% of all AI projects are failing
- What is the best model to use (LLM)
 - Failing on a long context

Notes (Cont)

- The focus here is Java
 - But most publishers are not interested in Java books, just AI books
 - It adds to confusion
 - What is the average developer is to believe?
 - Listening to a [section.ai](#) consulting
 - Their say they doing agents.
 - Because they are telling their investors that they are using
 - We are still fighting that folks don't know what AI is
 - They don't know what context means
 - They don't know how to protect sensitive data (90%)
 - Coding is fun, and they are taking it away (or at least want to)
 -

Notes (cont)

- We have this a big gap in knowledge of the subject area of AI
 - Frank +1 Lize efforts to create samples
 - Beyond making fun pictures
 - But they don't understand the security implications
- Pratik asks Frank
 - What is a real use of AI vs. just a chat bot
 - Taking data and summarize
 - Here is spreadsheet and categorize the columns
 - A simple solution
- Concern about no more Jr Developers
 - What is the motivation for them to get into CS classes and get into the field
 - The illusion that AI will remove all Java developers

Notes (Cont)

- Pratik says he has to create quarterly reports
 - Painful to do
 - AI Native
 - Starts with AI first
 - Data comes in and it automatically analyzes the data
 - Then creates the report
 - Detects anomalies and alerts Pratik
- Use cases
 - Lize has started a list of examples
 - Frank suggested to create how to move from deterministic to non-deterministic.
 - When to know when to use AI and not when to use it
 -

Notes Cont

- Bench Marks

- A year ago an article was written that states real productivity is getting worse
- Because of lack of knowledge
- We use it intuitively and not as a science
 - Not a culture but a science
- Did they provide examples of what they were doing?

- Architectural Drift

- Catalan and Vlad are writing an article for this
- They are creating a benchmark
- It is very easy to shift to make these harmful
- They are no oversight, to maintain the architectural disciplines
- The more LLM introduction causes degradation of Architecture
 - I.e. the more agents introduced causes the problem

Notes Cont

- Regenerate and validate reduces architecture degradation
- Split large problems into small components
 - Loose coupling
 - And this makes it doable.
 - Replace development with architecture
 - They fit into context
 - This reduces the problem
 - Regeneration instead of patching

What's next

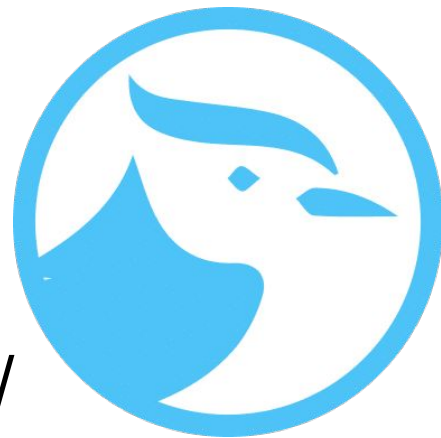

- Lize is working on example. Trying to get it together
- Find articles and group them tell folks “What is AI?”
 - Context
 - Things other than LLM
 - Terminology
- Make youtube videos to bring in new JR developers
 - Encourage them to get started
 - Bread and butter discussions?
- Capture data from community on what they need
 - Provide a page that they can share what they need
- Finding tutorials and sharing those in the new letter as a new section
-

Next Month

- Is there an MCP server to plug into code assistant/architect/design like Gemini Code Assist for:
 - Java
 - Spring
 - Quarkus
- Anyone done anything interesting with Clawdbot: <https://clawd.bot/> ?
- What cheap online models are ppl using for personal/small projects (available on platforms like open router)

- [] Share the YouTube link for the deterministic code-generation talk on conference/LinkedIn so the group can review the presentation and recording (Catalin Tudose)
- [] Create and kick off a set of enterprise reference implementations for Java + AI (covering data governance, zero retention, encryption, provenance, citations, re-ranking, query routing, auditability and observability) and recruit contributors across Java Platform groups and partners (Lize Raes)
- [] Add migration examples (including path from Python agents to Java agents and guidance for integrating deterministic and non-deterministic components) into the reference implementations (Lize Raes)
- [] Capture, consolidate, and post the meeting notes and the bot-captured transcript so the group can review and follow up (Glenn Renfro)
- [] Continue work...

Foojay
